## Description

The Silicon Power Computer & Communications industrial DDR3L SLU series products are 204-Pin Double Data Rate 3 (DDR3) Synchronous DRAM Small Outline Dual In-Line Memory Module (SODIMM), organized as a one rank 512Mx64, high-speed memory array or two ranks 1024Mx64 high-speed memory array, The module uses four 256x16 (2GB) eight 256Mx8(2GB), 512Mx8 (4GB), sixteen 512Mx8 (8GB) DDR3 SDRAMs in BGA packages

This DIMM are manufactured using raw cards developed for broad industry use as reference designs. The use of these common design files minimizes electrical variation between suppliers.

DDR3 SDRAM DIMM provide a high-performance, flexible 8-byte interface in a space-saving footprint.

The DIMM is intended for use in applications operating of 800MHz clock speeds and achieves high-speed data transfer rates of 1600Mbps. Prior to any access operation, the device CAS latency and burst/length/operation type must be programmed into the DIMM by address inputs A0-A13(128Mx8 or 128Mx16), A0-A14(256Mx8 or 256Mx16), A0-A15 (512Mx8) and I/O inputs BA0~BA2 using the mode register set cycle.

The DIMM uses serial presence-detect implemented via a serial EEPROM using a standard IIC protocol.

## Pin Description

Symbol	Type	Description
A0–A15	Input	<b>Address inputs:</b> Provide the row address for ACTIVE commands and the column address and auto precharge bit for READ/WRITE commands to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine whether the PRECHARGE applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA. A12 is sampled during READ and WRITE commands to determine if burst chop (on-the-fly) will be performed. The address inputs also provide the opcode during mode register command set. A0–A13 (128Mx8, 128Mx16) A0–A14 (256Mx8, 256Mx16) A0–A15 (512Mx8).
BA0–BA2	Input	<b>Bank address inputs:</b> BA0, BA1 define to which device bank an ACTIVE, READ, WRITE, or PRECHARGE command is being applied. BA0, BA1 define which mode register, including MR, EMR, EMR(2), and EMR(3), is loaded during the LOAD MODE command.
CK0, CK0#, CK1, CK1#	Input	<b>Clock:</b> CK and CK# are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of CK#. Output data (DQs and DQS/DQS#) is referenced to the crossings of CK and CK#.
CKE0, CEK1	Input	<b>Clock enable:</b> CEK (registered HIGH) activates and CEK (registered LOW) deactivates clocking circuitry on the DDR3 SDRAM.
DM0–DM7	Input	<b>Data input mask:</b> DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH, along with that input data, during a write access. DM is sampled on both edges of DQS. Although DM pins are input-only, the DM loading is designed to match that of DQ and DQS7pins.
ODT0 ODT1	Input	<b>On-die termination:</b> ODT (registered HIGH) enables termination resistance internal to the DDR3 SDRAM. When enabled, ODT is only applied to the following pins: DQ, DQS, DQS# and DM. The ODT input will be ignored if disabled via the LOAD MODE command.
RAS#, CAS#, WE#	Input	<b>Command inputs:</b> RAS#, CAS#, and WE# (along with S#) define the command being entered.
RESET#	Input (LVCMOS)	<b>Reset:</b> RESET# is an active LOW CMOS input referenced to V <sub>SS</sub> . The RESET# input receiver is a CMOS input defined as a rail-to-rail signal with DC HIGH $\geq 0.8 \times V_{DD}$ and DC LOW $\leq 0.2 \times V_{DD}$ .
S0#, S1#	Input	<b>Chip select:</b> S# enables (registered LOW) and disables (registered HIGH) the command decoder.
SA[2:0]	Input	<b>Presence-detect address inputs:</b> These pins are used to configure the SPD EEPROM address range.
SCL	Input	<b>Serial clock for presence-detect:</b> SCL is used to synchronize the presence-detect data transfer to and from the module.
DQ0–DQ63	I/O	<b>Data input/output:</b> Bidirectional data bus.
DQS0–DQS7 DQS0#–DQS7#	I/O	<b>Data strobe:</b> Output with read data, input with write data for source synchronous operation. Edge-aligned with read data, center-aligned with write data.
SDA	I/O	<b>Serial presence-detect data:</b> SDA is a bidirectional pin used to transfer addresses and data into and out of the SPD EEPROM on the module.
V <sub>DD</sub>	Supply	<b>Power supply:</b> 1.35V (+0.1~0.067V). The component V <sub>DD</sub> and V <sub>DDQ</sub> are connected to the module V <sub>DD</sub> .
V <sub>DDSPD</sub>	Supply	<b>Temperature sensor/SPD EEPROM power supply:</b> +3.0V to +3.6V.
V <sub>REFCA</sub>	Supply	<b>Reference voltage:</b> Control, command, and address (V <sub>DD</sub> /2).
V <sub>REFDQ</sub>	Supply	<b>Reference voltage:</b> DQ, DM (V <sub>DD</sub> /2).
V <sub>SS</sub>	Supply	Ground.
V <sub>TT</sub>	Supply	<b>Termination voltage:</b> Used for control, command, and address (V <sub>DD</sub> /2).
NC	–	<b>No connect:</b> These pins are not connected on the module.
NU	–	<b>Not used:</b> These pins are not used in specific module configuration/operations.

$P_{BAR}$	Barometric Pressure (operating & storage)	105 to 69	K Pascal	1, 2

Note:

- Stresses greater than those listed may cause permanent damage to the device. This is a stress rating only and device functional operation at or above the conditions indicated is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Up to 9850 ft.
- The component maximum case temperature shall not exceed the value specified in the component spec.

## Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Note
$V_{DD}$	Voltage on $V_{DD}$ pins relative to $V_{SS}$	-0.4 V ~ 1.975 V	V	1, 3
$V_{DDQ}$	Voltage on $V_{DDQ}$ pins relative to $V_{SS}$	-0.4 V ~ 1.975 V	V	1, 3
$V_{IN}, V_{OUT}$	Voltage on I/O pins relative to $V_{SS}$	-0.4 V ~ 1.975 V	V	1
$T_{STG}$	Storage Temperature	-55 to +100	°C	1, 2

Note:

- Operating Temperature  $T_{OPER}$  is the case surface temperature on the center / top side of the DRAM.
- The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 to 85 °C under all operating conditions
- Some applications require operation of the DRAM in the Extended Temperature Range between 85 °C and 95 °C case temperature. Full specifications are supported in this range, but the following additional conditions apply:
  - Refresh commands must be doubled in frequency, therefore reducing the Refresh interval tREFI to 3.9  $\mu$ s. It is also possible to specify a component with 1X refresh (tREFI to 7.8 $\mu$ s) in the Extended Temperature Range. Please refer to supplier data sheet and/or the DIMM SPD for option availability.
  - If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b) or enable the optional Auto Self-Refresh mode (MR2 A6 = 1b and MR2 A7 = 0b). Please refer to the supplier data sheet and/or the DIMM SPD for Auto Self-Refresh option availability, Extended Temperature Range support and tREFI requirements in the Extended Temperature Range.
