

eMMC 5.1

MLC / aSLC

(SAMSUNG 14nm MLC & MLC w/aSLC Technology)

PHANES-EA Series

Document No. : 100-23WEMMC-PEASM

Version No. : 02V0

Date : March, 2024

Image just for reference.

ISO 9001 : 2015 CERTIFIED

Product Features

- **Packaged NAND flash memory with eMMC 5.1 interface**
- **Compliant with eMMC Specification Ver.4.4, 4.41,4.5,5.0,5.1**
- **Package Form**
 - 153 Ball FFBGA(TFFBGA) Package
- **Bus mode**
 - High-speed eMMC protocol.
 - Clock frequency: 0-200MHz.
 - Ten-wire bus (clock, 1 bit command, 8 bit data bus) and a hardware reset.
- **Supports three different data bus widths :**
1 bit(default), 4 bits, 8 bits
 - Data transfer rate: up to 52Mbyte/s (using 8 parallel data lines at 52 MHz)
 - Single data rate : up to 200Mbyte/s @ 200MHz
 - Dual data rate : up to 400Mbyte/s @ 200MHz
- **Operating voltage range :**
 - Core Voltage (VCC): 2.7-3.6 V
 - I/O (VCCQ) Voltage: 1.7-1.95V/2.7-3.6V
- **Error free memory access**
 - Internal error correction code (ECC) to protect data communication.
 - Internal enhanced data management algorithm.
 - Solid protection of sudden power failure safe-update operations for data content
- **Security**
 - Support secure bad block erase commands
 - Enhanced write Protection with permanent and partial protection options
- **Quality**
 - RoHS compliant (for detailed RoHS declaration, please contact your APRO representative.)
 - Reliability report with AEC-Q100 test items (for the detail, please contact your APRO representative.)
- **Major Supported Features**
 - HS400, Field Firmware Update(FFU), Power Off Notification, Pre EOL information, Enhanced Device Life time, Optimal Size
- **Major Supported eMMC 5.1 Features:**
 - Enhanced Strobe, Cache Flushing Report, BKOPS Control, Cache Barrier, RPMB Throughput Improve, Secure Write Protection.
- **Ambient Operating Temperature Range**
 - Industrial: -40°C to 85°C
 - Automotive AEC-Q100 Grade3: -40°C to 85°C
 - Automotive AEC-Q100 Grade2: -40°C to 105°C
- **Mechanical**
 - Package Dimension 11.5 x 13.0 x 1.0 (mm)
 - Weight: 2g / 0.06 oz.
- **Capacity**
 - **MLC Solution:** 8GB & 16GB
 - **MLC w/aSLC Mode:** 4GB & 8GB
- **Certifications and Declarations**
 - **Certifications:** CE & FCC
 - **Declarations:** RoHS & REACH

1. INTRODUCTION

APRO eMMC is an embedded MMC solution designed in a FBGA package form. APRO eMMC operation is identical to a MMC device and therefore is a simple read and write to memory using MMC protocol v5.1 which is an industry standard.

APRO eMMC products follow the JEDEC eMMC 5.1 standard. It is an ideal universal storage solution for many electronic devices, including smartphones, tablets, PDAs, eBook readers, digital cameras, recorders, MP3, MP4 players, electronic learning products, digital TVs and set-top boxes. To fulfill the requirements of mobile application, APRO eMMC encloses the 2D-MLC NAND and eMMC controller inside as one JEDEC standard 153 ball FBGA(TFBGA) package, providing a standard interface to the host.

The eMMC controller directly manages NAND flash, including ECC, wear-leveling, IOPS optimization and read sensing.

Table 1 Device Summary

APRO eMMC 5.1 PHANES-EA Series MLC solution					
Capacity	Part Number	No. of Dies	NAND Flash Type	Package Size (mm)	Weight (g)
8GB	2/3/WEMMC008G-PEASM-53	1	2D-MLC	11.5 x 13 x 1.0	0.18
16GB	2/3/WEMMC016G-PEASM-53	2	2D-MLC	11.5 x 13 x 1.0	0.18
APRO eMMC 5.1 PHANES-EA Series MLC w/aSLC mode					
4GB	2/3/WEMMC004G-PEASMAS-53	1	2D-MLC	11.5 x 13 x 1.0	0.18
8GB	2/3/WEMMC008G-PEASMAS-53	2	2D-MLC	11.5 x 13 x 1.0	0.18

2. DEVICE POWER

2.1. Operating Voltage

Table 2-1 Operating Voltage

Symbol	Min	Max	Unit
VCCQ	1.7/2.7	1.95/3.6	V
VCC	2.7	3.6	V

Table 2-2 Device Power Consumption Standby

Speed Mode & Operation		MLC Solution		MLC w/aSLC mode		Unit
		8GB	16GB	8GB	16GB	
HS400	Sleep	85	90	85	90	uA
	Standby ICCQ	130	140	130	140	uA
	Standby I _{cc}	40	50	40	50	uA
HS200	Sleep	85	90	85	90	uA
	Standby ICCQ	130	140	130	140	uA
	Standby I _{cc}	40	50	40	50	uA
DDR52	Sleep	90	95	90	95	uA
	Standby ICCQ	140	150	140	150	uA
	Standby I _{cc}	40	55	40	55	uA
SDR52	Sleep	90	95	90	95	uA
	Standby ICCQ	140	150	140	150	uA
	Standby I _{cc}	40	55	40	55	uA

NOTES:

1. Standby current is measured at TA=25°C, VCC=3.3V, VCCQ=1.8V in HS400 & HS200 mode and at VCC=3.3V, VCCQ=3.3V in DDR52MHz & SDR52MHz mode, 8-bit bus width without clock frequency.
2. Current numbers might be subject to changes without notice.
3. Device power consumption standby values are estimated results only for reference. The actual values will be updated in the formal datasheets.

Table 2-3 Device Power Consumption RMS

Speed Mode & Operation			MLC Solution		MLC w/aSLC mode		Unit
			8GB	16GB	4GB	8GB	
HS400	Read	ICC	45	45	45	45	mA
		ICCQ	175	175	170	170	mA
	Write	ICC	40	75	45	75	mA
		ICCQ	80	85	80	85	mA
HS200	Read	ICC	40	40	40	40	mA
		ICCQ	140	145	145	145	mA
	Write	ICC	40	75	45	75	mA
		ICCQ	80	85	80	85	mA
DDR52	Read	ICC	25	25	25	25	mA
		ICCQ	130	130	130	130	mA
	Write	ICC	40	65	45	70	mA
		ICCQ	70	75	70	75	mA
SDR52	Read	ICC	20	20	20	20	mA
		ICCQ	100	100	100	100	mA
	Write	ICC	40	60	40	60	mA
		ICCQ	70	75	70	75	mA

NOTES:

1. The measurement for max RMS current is done as average RMS current consumption over a period of 100ms.
2. The RMS current is measured at TA=25°C, VCC=3.3V, VCCQ=1.8V in HS400 & HS200 mode and at VCC=3.3V, VCCQ=3.3V in DDR52MHz & SDR52MHz mode, 8-bit bus width without clock frequency.
3. Current numbers might be subject to changes without notice.

3. PERFORMANCE

3.1. Typical Sequential Performance

Table 3-1 Sequential Burst Performance

Speed Mode & Operation			MLC Solution		MLC w/aSLC mode		Unit
			8GB	16GB	4GB	8GB	
HS400	Write Cache on	Read	225	225	225	225	MB/s
		Write	105	140	105	140	MB/s
	Write Cache off	Read	225	225	225	225	MB/s
		Write	100	125	100	125	MB/s
HS200	Write Cache on	Read	160	160	160	160	MB/s
		Write	105	125	105	125	MB/s
	Write Cache off	Read	160	160	160	160	MB/s
		Write	95	115	95	115	MB/s
DDR52	Write Cache on	Read	80	80	80	80	MB/s
		Write	65	70	65	70	MB/s
	Write Cache off	Read	80	80	80	80	MB/s
		Write	65	65	65	65	MB/s
SDR52	Write Cache on	Read	45	45	45	45	MB/s
		Write	40	40	40	40	MB/s
	Write Cache off	Read	45	45	45	45	MB/s
		Write	35	40	35	40	MB/s

NOTES:

1. Values given for an 8-bit bus width, running from APRO proprietary tool.
2. Performance is measured at VCC=3.3V, VCCQ=1.8V in HS400 & HS200 mode and at VCC=3.3V, VCCQ=3.3V in DDR52MHz & SDR52MHz mode.
3. Performance numbers might be subject to changes without notice.
4. The write cache size is 512Kb.

Table 3-2 Sequential Sustained Performance (Normal Status)

Speed Mode & Operation			MLC Solution		MLC w/aSLC mode		Unit
			8GB	16GB	4GB	8GB	
HS400	Write Cache on	Read	225	225	225	225	MB/s
		Write	30	60	105	135	MB/s
	Write Cache off	Read	225	225	225	225	MB/s
		Write	20	25	95	125	MB/s
HS200	Write Cache on	Read	160	160	160	160	MB/s
		Write	30	60	105	125	MB/s
	Write Cache off	Read	160	160	160	160	MB/s
		Write	20	25	95	115	MB/s
DDR52	Write Cache on	Read	80	80	80	80	MB/s
		Write	30	55	65	70	MB/s
	Write Cache off	Read	80	80	80	80	MB/s
		Write	20	25	65	65	MB/s
SDR52	Write Cache on	Read	45	45	45	45	MB/s
		Write	30	40	40	40	MB/s
	Write Cache off	Read	45	45	45	45	MB/s
		Write	20	20	35	40	MB/s

NOTES:

1. Values given for an 8-bit bus width, running from APRO proprietary tool.
2. Performance is measured at VCC=3.3V, VCCQ=1.8V in HS400 & HS200 mode and at VCC=3.3V, VCCQ=3.3V in DDR52MHz & SDR52MHz mode.
3. Performance numbers might be subject to changes without notice.
4. The write cache size is 512Kb.

3.2. Typical Random Performance

Table 3-3 Random Burst Performance

Speed Mode & Operation			MLC Solution		MLC w/aSLC mode		Unit
			8GB	16GB	4GB	8GB	
HS400	Write Cache on	Read	5200	5300	5200	5300	IOPS
		Write	9800	10200	9800	10200	IOPS
	Write Cache off	Read	5300	5300	5300	5300	IOPS
		Write	2200	2200	2200	2200	IOPS
HS200	Write Cache on	Read	5300	5300	5300	5300	IOPS
		Write	9700	10100	9700	10100	IOPS
	Write Cache off	Read	5300	5300	5300	5300	IOPS
		Write	2200	2200	2200	2200	IOPS
DDR52	Write Cache on	Read	4900	4800	4900	4800	IOPS
		Write	7100	7900	7100	7900	IOPS
	Write Cache off	Read	4900	4900	4900	4900	IOPS
		Write	2200	2100	2200	2100	IOPS
SDR52	Write Cache on	Read	4100	4000	4100	4000	IOPS
		Write	6100	6200	6100	6200	IOPS
	Write Cache off	Read	4100	4100	4100	4100	IOPS
		Write	2000	2000	2000	2000	IOPS

NOTES:

1. Values given for an 8-bit bus width, running from APRO proprietary tool.
2. Performance is measured at VCC=3.3V, VCCQ=1.8V in HS400 & HS200 mode and at VCC=3.3V, VCCQ=3.3V in DDR52MHz & SDR52MHz mode.
3. Performance numbers might be subject to changes without notice.
4. The write cache size is 512Kb.

Table 3-4 Random Sustained Performance

Speed Mode & Operation			MLC Solution		MLC w/aSLC mode		Unit
			8GB	16GB	4GB	8GB	
HS400	Write Cache on	Read	4900	4900	5200	5300	IOPS
		Write	6400	6400	9800	10200	IOPS
	Write Cache off	Read	4900	4900	2200	2200	IOPS
		Write	1500	1400	1300	1400	IOPS
HS200	Write Cache on	Read	4900	5000	5300	5300	IOPS
		Write	6200	6300	9700	10100	IOPS
	Write Cache off	Read	4900	5000	5300	5300	IOPS
		Write	1400	1400	2200	2200	IOPS
DDR52	Write Cache on	Read	4500	4600	4900	4800	IOPS
		Write	5800	5900	7100	7900	IOPS
	Write Cache off	Read	4500	4600	4900	4900	IOPS
		Write	1400	1400	2200	2100	IOPS
SDR52	Write Cache on	Read	3900	3900	4100	4000	IOPS
		Write	5200	5400	6100	6200	IOPS

		Write	1300	1300	2000	2000	IOPS

NOTES:

1. Values given for an 8-bit bus width, running from APRO proprietary tool.
2. Performance is measured at VCC=3.3V, VCCQ=1.8V in HS400 & HS200 mode and at VCC=3.3V, VCCQ=3.3V in DDR52MHz & SDR52MHz mode.
3. Performance numbers might be subject to changes without notice.
4. The write cache size is 512Kb.

4. OPERATING CONDITIONS

4.1. Operating and Storage Temperature

Table 4-1 Operating and Storage Temperatures: Industrial Grade

Condition	Temperature
Minimum and Maximum Ambient ¹ Temperature	-40°C to 85°C
Maximum Case Operating Temperature	95°C
Minimum and Maximum Non-operating Temperature ²	-40°C to 85°C

NOTES:

1. To achieve optimized power and performance, case temperature should not exceed maximum ambient operating temperature.
2. After being soldered onto PCBA.

5. USER DENSITY

5.1. Capacity According to Partition

Table 5-1 Capacity According to Partition

MLC Solution			
Device	Boot Partition 1	Boot Partition 2	RPMB
8GB	4096 KB	4096 KB	4096 KB
16GB	4096 KB	4096 KB	4096 KB
MLC w/aSLC mode			
Device	Boot Partition 1	Boot Partition 2	RPMB
4GB	4096 KB	4096 KB	4096 KB
8GB	4096 KB	4096 KB	4096 KB

Table 5-2 User Density Size

Flash Mode	Device	User Density Size
MLC	8GB	7,837,581,312 Bytes
	16GB	15,675,162,624 Bytes
MLC w/aSLC mode	4GB	3,917,479,936 Bytes
	8GB	7,834,959,872 Bytes

6. eMMC Device and System

6.1. eMMC System Overview

The eMMC specification covers the behavior of the interface and the Device controller. As part of this specification the existence of a host controller and a memory storage array are implied but the operation of these pieces is not fully specified.

APRO NAND Device consists of a single chip MMC controller and NAND flash memory module. The micro- controller interfaces with a host system allowing data to be written to and read from the NAND flash memory module. The controller allows the host to be independent from details of erasing and programming the flash memory.

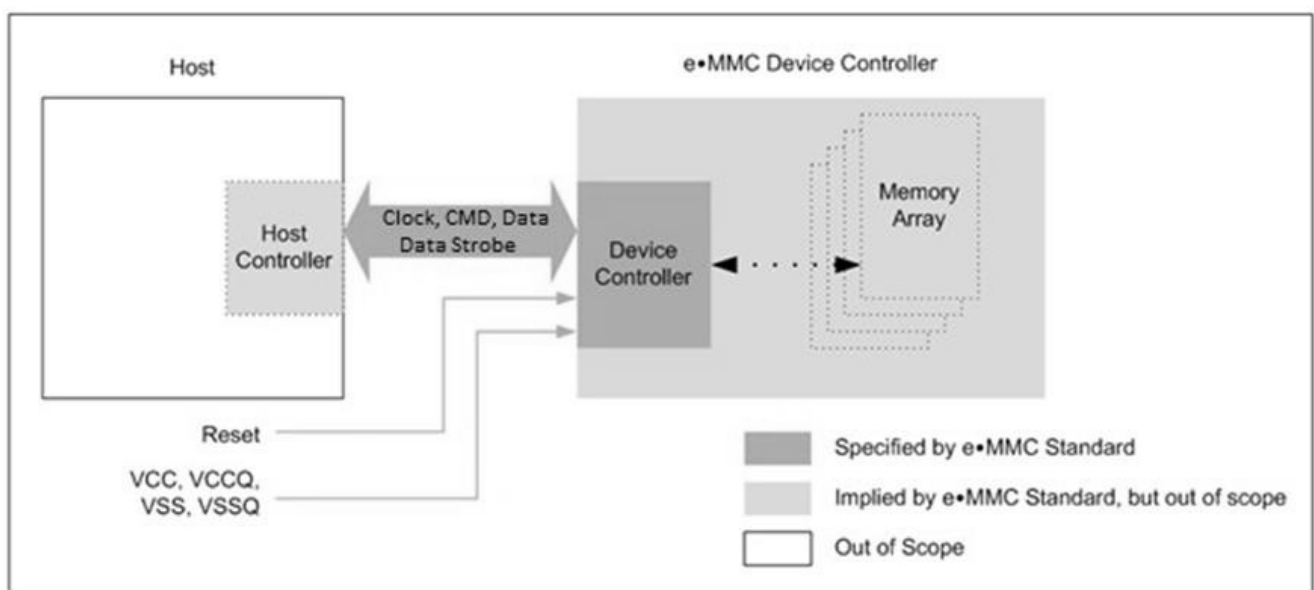

Figure 6-1 eMMC System Overview

6.2. Memory Addressing

Previous implementations of the eMMC specification are following byte addressing with 32-bit field. This addressing mechanism permitted for eMMC densities up to and including 2 GB.

To support larger densities the addressing mechanism was update to support sector addresses (512 B sectors). The sector addresses shall be used for all devices with capacity larger than 2 GB.

To determine the addressing mode use the host should read bit [30:29] in the OCR register.

6.3. eMMC Device Overview

The eMMC device transfers data via a configurable number of data bus signals. The communication signals are:

6.3.1. Clock (CLK)

Each cycle of this signal directs a one-bit transfer on the command and either a one bit (1x) or a two bits transfer (2x) on all the data lines. The frequency may vary between zero and the maximum clock frequency.

6.3.2. Data Strobe(DS)

This signal is generated by the device and used for output in HS400 mode. The frequency of this signal follows the frequency of CLK. For data output each cycle of this signal directs two bits transfer(2x) on the data - one bit for positive edge and the other bit for negative edge. For CRC status response output and CMD response output (enabled only HS400 enhanced strobe mode), the CRC status is latched on the positive edge only, and don't care on the negative edge.

6.3.3. Command (CMD)

This signal is a bidirectional command channel used for Device initialization and transfer of commands. The CMD signal has two operation modes: open-drain for initialization mode, and push-pull for fast command transfer. Commands are sent from the eMMC host controller to the eMMC Device and responses are sent from the Device to the host.

6.3.4. Input/Outputs (DAT0-DAT7)

These are bidirectional data channels. The DAT signals operate in push-pull mode. Only the Device or the host is driving these signals at a time. By default, after power up or reset, only DAT0 is used for data transfer. A wider data bus can be configured for data transfer, using either DAT0-DAT3 or DAT0-DAT7, by the eMMC host controller. The eMMC Device includes internal pull-ups for data lines DAT1-DAT7. Immediately after entering the 4-bit mode, the Device disconnects the internal pull ups of lines DAT1, DAT2, and DAT3. Correspondingly, immediately after entering to the 8-bit mode the Device disconnects the internal pull-ups of lines DAT1-DAT7.

Table 6-1 Communication Interface

Name	Type1	Description
CLK	I	Clock
DAT0	I/O/PP	Data
DAT1	I/O/PP	Data
DAT2	I/O/PP	Data
DAT3	I/O/PP	Data
DAT4	I/O/PP	Data
DAT5	I/O/PP	Data
DAT6	I/O/PP	Data
DAT7	I/O/PP	Data
CMD	I/O/PP/OD	Command/Response
RST_n	I	Hardware reset
VCC	S	Supply voltage for Core
VCCQ	S	Supply voltage for I/O
VSS	S	Supply voltage ground for Core
VSSQ	S	Supply voltage ground for I/O
DS	O/PP	Data strobe
VDDi		Connect capacitor from VDDi to GND for stabilize internal power

Note1 : I: input; O: output; PP: push-pull; OD: open-drain; NC: Not connected (or logical high); S: power supply.

7. eMMC FUNCTIONAL DESCRIPTION

7.1. Enhanced MLC Technology (aSLC)

Each cell in an MLC NAND can be programmed to store 2 bits of data with 4 total voltage states. In enhance-MLC (aSLC) mode, the memory cell is used in 1-bit mode, thus resulting in higher endurance, lower error rates and extended temperature range. APRO firmware optimizes the eMMC device with Pseudo technology to achieve industrial and automotive level reliability. For APRO eMMC device, enhance-MLC (aSLC) mode provides half capacity of MLC mode.

7.2. Field Firmware Update(FFU)

Field Firmware Updates (FFU) enables features enhancement in the field. Using this mechanism, the host downloads a new version of the firmware to the eMMC device and, following a successful download, instructs the eMMC device to install the new downloaded firmware into the device.

In order to start the FFU process the host first checks if the eMMC device supports FFU capabilities by reading SUPPORTED_MODES and FW_CONFIG fields in the EXT_CSD. If the eMMC device supports the FFU feature the host may start the FFU process. The FFU process starts by switching to FFU Mode in MODE_CONFIG field in the EXT_CSD. In FFU Mode host should use closed-ended or open ended commands for downloading the new firmware and reading vendor proprietary data. In this mode, the host should set the argument of these commands to be as defined in FFU_ARG field. In case these commands have a different argument the device behavior is not defined and the FFU process may fail. The host should set Block Length to be DATA_SECTOR_SIZE. Downloaded

firmware bundle must be DATA_SECTOR_SIZE size aligned (internal padding of the bundle might be required). Once in FFU Mode the host may send the new firmware bundle to the device using one or more write commands.

The host could regain regular functionality of write and read commands by setting MODE_CONFIG field in the EXT_CSD back to Normal state. Switching out of FFU Mode may abort the firmware download operation. When host switched back to FFU Mode, the host should check the FFU Status to get indication about the number of sectors which were downloaded successfully by reading the NUMBER_OF_FW_SECTORS_CORRECTLY_PROGRAMMED in the extended CSD. In case the number of sectors which were downloaded successfully is zero the host should re-start downloading the new firmware bundle from its first sector. In case the number of sectors which were downloaded successfully is positive the host should continue the download from the next sector, which would resume the firmware download operation.

In case MODE_OPERATION_CODES field is not supported by the device the host sets to NORMAL state and initiates a CMD0/HW_Reset/Power cycle to install the new firmware. In such case the device doesn't need to use NUMBER_OF_FW_SECTORS_CORRECTLY_PROGRAMMED.

In both cases occurrence of a CMD0/HW_Reset/Power occurred before the host successfully downloaded the new firmware bundle to the device may cause the firmware download process to be aborted.

7.3. Power off Notification for Sleep

The host should notify the device before it powers the device off. This allows the device to better prepare itself for being powered off. Power the device off means to turn off all its power supplies. In particular, the host should issue a power off notification (POWER_OFF_LONG, POWER_OFF_SHORT) if it intends to turn off both VCC and VCCQ power I or it may use to a power off notification (SLEEP_NOTIFICATION) if it intends to turn-off VCC after moving the device to Sleep state.

To indicate to the device that power off notification is supported by the host, a supporting host shall first set the POWER_OFF_NOTIFICATION byte in EXT_CSD [34] to POWERED_ON (0x01). To execute a power off, before powering the device down the host will change the value to either POWER_OFF_SHORT (0x02) or POWER_OFF_LONG (0x03). Host should wait for the busy line to be de-asserted. Once the setting has changed to either 0x02 or 0x03, host may safely power off the device.

The host may issue SLEEP_AWAKE (CMD5) to enter or to exit from Sleep state if POWER_OFF_NOTIFICATION byte is set to POWERED_ON. Before moving to Standby state and then to Sleep state, the host sets POWER_OFF_NOTIFICATION to SLEEP_NOTIFICATION and waits for the DAT0 line de-assertion. While in Sleep (slp) state VCC (Memory supply) may be turned off as defined in 4.1.6. Removing power supplies other than VCC while the device is in the Sleep (slp) state may result in undefined device behavior. Before removing all power supplies, the host should transition the device out of Sleep (slp) state back to Transfer state using CMD5 and CMD7 and then execute a power off notification setting POWER_OFF_NOTIFICATION byte to either POWER_OFF_SHORT or POWER_OFF_LONG.

If host continues to send commands to the device after switching to the power off setting (POWER_OFF_LONG, POWER_OFF_SHORT or SLEEP_NOTIFICATION) or performs HPI during its busy condition, the device shall restore the POWER_OFF_NOTIFICATION byte to POWERED_ON.

If host tries to change POWER_OFF_NOTIFICATION to 0x00 after writing another value there, a SWITCH_ERROR is generated.

The difference between the two power-off modes is how urgent the host wants to turn power off. The device should respond to POWER_OFF_SHORT quickly under the generic CMD6 timeout. If more time is acceptable, POWER_OFF_LONG may be used and the device shall respond to it within the POWER_OFF_LONG_TIME timeout.

While POWER_OFF_NOTIFICATION is set to POWERED_ON, the device expects the host to host shall:

- Keep the device power supplies alive (both VCC and VCCQ) and in their active mode
- Not power off the device intentionally before changing POWER_OFF_NOTIFICATION to either POWER_OFF_LONG or POWER_OFF_SHORT
- Not power off VCC intentionally before changing POWER_OFF_NOTIFICATION to SLEEP_NOTIFICATION and before moving the device to Sleep state

Before moving to Sleep state hosts may set the POWER_OFF_NOTIFICATION byte to SLEEP_NOTIFICATION (0x04) if aware that the device is capable of autonomously initiating background operations for possible performance improvements. Host should wait for the busy line to be de-asserted. Busy line may be asserted up the period defined in SLEEP_NOTIFICATION_TIME byte in EXT_CSD [216]. Once the setting has changed to 0x04 host may set the device into Sleep mode (CMD7+CMD5). After getting out from Sleep the POWER_OFF_NOTIFICATION byte will restore its value to POWERED_ON. HPI may interrupt the SLEEP_NOTIFICATION operation. In that case POWER_OFF_NOTIFICATION byte will restore to POWERED_ON.

7.4. Enhanced User Data Area

APRO eMMC supports Enhanced User Data Area feature which allows the User Data Area of eMMC to be configured as SLC Mode. Therefore, when host set the Enhanced User Data Area, the area will occupy more size of original set up size. The Max Enhanced User Data Area size is defined as - (MAX_ENH_SIZE_MULT x HC_WP_GRP_SIZE x HC_ERASE_GRP_SIZE x 512 KBytes). The Enhanced use data area size is defined as (ENH_SIZE_MULT x HC_WP_GRP_SIZE x HC_ERASE_GRP_SIZE x 512 KBytes). The host shall follow the flow chart of JEDEC spec for configuring the parameters of General-Purpose Area Partitions and Enhanced User Data Area.

7.5. Write Cache

Cache is a temporary storage space in an eMMC device. The cache should in typical case reduce the access time and increase the speed (compared to an access to the main nonvolatile storage). The cache is not directly accessible by the host. This temporary storage space may be utilized also for some implementation specific operations like as an execution memory for the memory controller and/or as storage for an address mapping table etc. However, there is data inconsistency risk when using nonvolatile cache. It's recommend only turning on the cache for the application which requires not too high reliability.

The cache shall be OFF by default after power up, RST_n assertion or CMD0. All accesses shall be directed to the nonvolatile storage like defined elsewhere in this specification. The cache function can be turned ON and OFF by writing to the CACHE_CTRL byte (EXT_CSD byte [33]). Turning the cache ON shall enable behavior model defined in this section. Turning the cache OFF shall trigger flushing of the data to the nonvolatile storage.

7.6. Cache Enhancement Barrier

Barrier function provides a way to perform a delayed in-order flushing of a cached data. The main motivation for using barrier commands is to avoid the long delay that is introduced by flush commands. There are cases where the host is not interested in flushing the data right away, however it would like to keep an order between different cached data batches. The barrier command enables the host achieving the in-order goal but without paying the flush delay, since the real flushing can be delayed by the device to some later idle time. The formal definition of the barrier rule is as follows:

Denote a sequence of requests R_i , $i=0,..,N$. Assuming a barrier is set between requests R_x and R_{x+1} ($0 < x < N$) then all the requests $R_0..R_x$ must be flushed to the non-volatile memory before any of the requests $R_{x+1}..R_N$.

Between two barriers the device is free to write data into the non-volatile memory in any order. If the host wants to preserve a certain order it shall flush the cache or set another barrier at a point where order is important. The barrier is set by writing to the BARRIER bit of the FLUSH_CACHE byte (EXT_CSD byte [32]). Any error resulted can be read from the status register by CMD13 after the completion of the programming as defined for a normal write request. The error could affect any data written to the cache since the previous flush operation.

The device shall support any number of barrier commands between two flush commands. In case of multiple barrier commands between two flush commands a subset of the cached data may be committed to the non-volatile memory according to the barrier rule. Internally, a device may have an upper limit on the barrier amount it can absorb without flushing the cache. That is, if the host exceeds this barrier amount, the device may issue, internally, a normal flush.

The device shall expose its barrier support capability via the BARRIER_SUPPORT byte (EXT_CSD byte [486]). If a device does not support barrier function this register shall be zero. If a device supports barrier function this register shall be one.

Assuming the device supports barrier function, if the BARRIER bit of the FLUSH_CACHE byte is set, a barrier operation shall be executed.

If the cache gets totally full and/or the cache is not able to receive the data of the next access (per block count indicated in CMD23 or per initiated single / open ended multiple blocks write in general) then it shall still be the responsibility of the eMMC device to store the data of the next access within the timeouts that are specified elsewhere in this specification. The actual algorithm to handle the new data and possible flush of some older cached data is left for the implementation.

Note: When issuing a force-programming write request (CMD23 with bit 24 on) or a reliable write request (CMD23 with bit 31 on), the host should be aware that the data will be written to the non-volatile memory, potentially, before any cached data, even if a barrier command was issued. Therefore, if the writing order to the non-volatile memory is important, it is the responsibility of the host to issue a flush command before the force-programming or the reliable-write request. In order to use the barrier function, the host shall set bit 0 of BARRIER_EN (EXT_CSD byte [31]). The barrier feature is optional for an eMMC device.

7.7. Cache Flushing Policy

The host may require the device to flush data from the cache in an in-order manner. From time to time, to guarantee in-order flushing, the host may command the device to flush the device cache or may use a barrier command.

However, if the eMMC device flushing policy is to flush data from the cache in an in-order manner, cache barrier commands or flush commands operations (In case goal is to guarantee the flushing order) are redundant and impose a needless overhead to the device and host.

FIFO bit in CACHE_FLUSH_POLICY field (EXT_CSD byte [240]) is used by the device to indicate to the host that the device cache flushing policy is First-In-First-Out; this means that the device guarantees that the order of the flushing of data would be the in same order which data was written to the cache. When the FIFO bit is set it is recommended for the host not to send cache barrier commands or flush operations which goal is to guarantee the flushing order as they are redundant and impose a burden to the system.

However, if the FIFO bit is set to 1b and the device supports the cache barrier mechanism, the host may still send barrier commands without getting an error. Sending these commands will not change the device behavior as device flushes cache in-order anyway. The CACHE_FLUSH_POLICY field is read-only field and never change its value either by the host or device.

7.8. Production State Awareness (PSA)

eMMC device could utilize the information of whether it is in production environment and operate differently than it operates in the field.

For example, content that was loaded into the storage device prior to soldering might get corrupted, at higher probability, during device soldering. The eMMC device could use "special" internal operations for loading content prior to device soldering that would reduce production failures and use "regular" operations post-soldering.

PRODUCTION_STATE_AWARENESS [133] field in extended CSD is used as a mechanism through which the host should report to the device whether it is pre or post soldering state.

This standard defines two methods, Manual Mode and Auto Mode, to manage the device production state.

The trigger for starting or re-starting the process is setting correctly PRE_LOADING_DATA_SIZE field. Before setting this field the host is expected to make sure that the device is clean and any data that was written before to the device is expected to be erased using CMD35, CMD36 and CMD38.

In case the host erased data, overrode existing data or performed re-partition during production state awareness it should restart the production state awareness process by re-setting PRE_LOADING_DATA_SIZE.

APRO defines Pseudo SLC mode as special internal operation of PSA to have better reliability during the soldering process in production (reflow). APRO has adopted mechanisms to recover the MLC behavior after the end of production. Once the host used over the threshold, the PSA feature is disabled and the firmware will start to merge pSLC blocks to MLC block to make drive returns to original situation. Threshold values of PSA are different according to NAND mode:

- MLC – 50% of user capacity

8. REGISTER SETTINGS

Within the Device interface six registers are defined: OCR, CID, CSD, EXT_CSD, RCA and DSR. These can be accessed only by corresponding commands (see Section 6.10 of JESD84-B51).

8.1. OCR Register

The 32-bit operation conditions register (OCR) stores the VDD voltage profile of the Device and the access mode indication. In addition, this register includes a status information bit. This status bit is set if the Device power up procedure has been finished. The OCR register shall be implemented by all Devices.

Table 8-1 OCR Register

OCR bit	VDD voltage window	High Voltage Value	Dual Voltage Value
[6:0]	Reserved	00 00000b	00 00000b
[7]	1.70 - 1.95V	0b	1b
[14:8]	2.0-2.7V	000 0000b	000 0000b
[23:15]	2.7-3.6V	1 1111 1111b	1 1111 1111b
[28:24]	Reserved	0 0000b	0 0000b
[30:29]	Access Mode	00b (byte mode) 10b (sector mode)	00b (byte mode) 10b (sector mode)
[31]	Device power up status bit (busy) ¹		

NOTES:

1. This bit is set to LOW if the Device has not finished the power up routine.

8.2. CID Register

The Card Identification (CID) register is 128 bits wide. It contains the Device identification information used during the Device identification phase (eMMC protocol). For details, refer to JEDEC Standard Specification.

Table 8-2 CID Register

CID Fields Name	Field	Width	CID slice	Value
Manufacturer ID	MID	8	[127:120]	32h

Reserved	-	1	[0:0]	1h

NOTE1: The descriptions are same as e.MMC™ JEDEC standard

8.3. CSD Register

The Card-Specific Data (CSD) register provides information on how to access the contents stored in eMMC. The CSD registers are used to define the error correction type, maximum data access time, data transfer speed, data format...etc. For details, refer to section 7.3 of the JEDEC Standard Specification No. JESD84-B51.

Table 8-3 CSD Register

8.4. Extended CSD Register

The Extended CSD register defines the Device properties and selected modes. It is 512 bytes long. The most significant 320 bytes are the Properties segment, which defines the Device capabilities and cannot be modified by the host. The lower 192 bytes are the Modes segment, which defines the configuration the Device is working in. These modes can be changed by the host by means of the SWITCH command.

NOTES:

1. Reserved bits should read as "0."
2. Obsolete values should be don't care.
3. This field is 0 after power-on, H/W reset or software reset, thus selecting the backwards compatibility interface timing for the Device. If the host sets 1 to this field, the Device changes its timing to high speed interface timing (see Section 10.6.1 of JESD84-B50). If the host sets value 2 the Device changes its timing to HS200 interface timing (see Section 10.8.1 of JESD84-B50), If the host sets HS_TIMING[3:0] to 0x3, the device changes its timing to HS400 interface timing (see 10.10).
4. It is set to '0' (1 bit data bus) after power up and can be changed by a SWITCH command.
5. * Changed by Firmware release note.
6. The values of Device version, Cache size, Sector Count, Max Enhanced Area Size, Enhanced User Data Area Size and Max pre loading data size are expressed in Decimal, while the value of h is the abbreviation of Hexadecimal.

9. PACKAGE CONNECTIONS

Package Mechanical (11.5 x 13.0 x 1.0mm)

MEMA Series is assembled in a JEDEC standard 153 ball FBGA(TFBGA) package. Please refer below figure for relevant parameters of package dimension.

10. SIGNAL DESCRIPTION

Table 11-1 Signal Description

Pin	Description
CLK	Clock Signal.
CMD	Command Signal.
DS	Data Strobe Signal, Used in HS400 mode.
DAT0~7	Data Bus.
RST_N	Hardware Reset Signal.
VCC	Supply voltage for controller and Flash memory power.
VCCQ	Supply voltage for controller and Flash memory IO power.
VDDi	Connect capacitor from VDDi to GND for stabilize internal power.
VSS	Supply voltage ground for controller and Flash memory. Can be short with VSSQ.
VSSQ	Supply voltage ground for controller and IO Flash memory. Can be short with VSSQ.
NC	In eMMC chip is no connect. Left it floating.
RFU	Reserved for future use. Left it floating for future use.
VSF	Vendor Specific Function. Reserved for test points on the PCB, default NU (Not Used)

Note :

Some balls could be floated to achieve eMMC 4.5 force conversion.

- A6 VSS →Float NC
- J5 VSS →Float NC
- H5 DS →Float NC

Appendix A: Limited Warranty

APRO warrants your eMMC PHANES-EA Series against defects in material and workmanship for the life of the drive. The warranty is void in the case of misuse, accident, alteration, improper installation, misapplication or the result of unauthorized service or repair. The implied warranties of merchantability and fitness for a particular purpose, and all other warranties, expressed or implied, except as set forth in this warranty, shall not apply to the products delivered. In no event shall APRO be liable for any lost profits, lost savings or other incidental or consequential damages arising out of the use of, or inability to use, this product.

BEFORE RETURNING PRODUCT, A RETURN MATERIAL AUTHORIZATION (RMA) MUST BE OBTAINED FROM APRO.

Product shall be returned to APRO with shipping prepaid. If the product fails to conform based on customers' purchasing orders, APRO will reimburse customers for the transportation charges incurred.

WARRANTY PERIOD:

- **MLC Solution: 2 years / Within 3K Erasing Counts**
- **aSLC NAND Solution: 2 years / Within 20K Erasing Counts**
